OBJECTIVE

Electronics and Telecommunications Engineering student at VNU-HCM University of Science with a strong, self-driven focus on Artificial Intelligence and Generative AI. My background in signal processing, embedded systems, and mathematics provides a solid engineering foundation that I actively bridge into AI: I have independently built end-to-end AI projects including a RAG-based Vietnamese technical document Q&A chatbot (LangChain, ChromaDB, Gemini API) and an LSTM IoT temperature forecasting system integrated with AWS DynamoDB. Currently expanding into agentic AI workflows with LangGraph. Seeking an AI Engineer Intern role to contribute to real-world GenAI, RAG, and AI Agent development while deepening expertise in LLM engineering and multi-agent systems.

PROJECTS

ViTechQA – Vietnamese Technical Document Q&A System

05/2025 – Present

Python, LangChain, ChromaDB, Sentence-Transformers, Gemini API, Gradio

Individual Project

- Built a full-stack RAG chatbot enabling Vietnamese-language Q&A over uploaded technical PDF documents, with semantic retrieval grounded strictly in source context.
- Designed and implemented the complete pipeline: PDF extraction, chunking strategy, vector embedding using BAAI/bge-m3, semantic search via ChromaDB, and response generation with Gemini API.
- Applied advanced prompt engineering to minimize hallucination and keep answers factually anchored in retrieved passages; deployed a Gradio web interface for live interactive demo.

IoT Temperature Forecasting System with LSTM

04/2025 – 05/2025

Python, TensorFlow/Keras, AWS DynamoDB, Boto3, Streamlit, ESP32

Team Project

- Designed and deployed an end-to-end real-time temperature forecasting pipeline, integrating ESP32 + DHT11 IoT hardware with a cloud backend and a deep learning prediction model.
- Collected streaming sensor data via AWS DynamoDB; trained an LSTM model to predict temperature 10 minutes ahead using a sliding window approach (look-back = 10 timesteps).
- Preprocessed raw sensor data (MinMaxScaler normalization, noise filtering); achieved stable forecast performance across varying ambient conditions. Conducted EDA and feature engineering on time-series sensor data.

EDUCATION

VNU-HCM UNIVERSITY OF SCIENCE

Ho Chi Minh City, Vietnam

Bachelor of Electronics and Communication Engineering

2023 – 2027

- **GPA:** 8.9 / 10.0 – Top of cohort within the Faculty of Electronics and Telecommunications.
- Faculty Academic Encouragement Scholarship, Faculty of Electronics and Telecommunications (Semester 1, 2024–2025) – awarded to students with outstanding academic performance.
- Relevant coursework: Digital Signal Processing, Embedded Systems, Probability and Statistics, Linear Algebra, Programming with Python and C++.

ADDITIONAL INFORMATION

GenAI & LLMs: Large Language Models, LangChain, LangGraph (in progress), ChromaDB, Prompt Engineering, Gemini API, RAG pipeline design, vector search optimization, AI Agent workflows.

Machine Learning & Deep Learning: CNN, RNN, LSTM, Transformer architectures, TensorFlow/Keras, Scikit-learn; hands-on experience training models on real-world IoT and NLP datasets; familiar with Computer Vision fundamentals (image classification, CNNs).

Data & Algorithms: NumPy, Pandas, SQL, data cleaning, EDA, feature engineering; core CS fundamentals – searching, sorting, graphs, trees, stacks, queues.

Tools & Languages: Python (primary), C++, MATLAB, SQL, Git/GitHub, Jupyter Notebook, AWS DynamoDB, Boto3, LaTeX, Microsoft Office Suite.

Certifications: Machine Learning Specialization (2025) & Deep Learning Specialization (2026) – DeepLearning.AI via Coursera.

Languages: Vietnamese (native), English (familiar working proficiency in technical documentation and development environments).
